Chapter 2
HEAD

- The **\<head\>** element contains all the information that isn't displayed.

- The **\<meta\>** tag can define many kinds of attributes. When defining a **\<meta\>** tag one first needs to provide the **name** of the attribute followed by its **content**.

- **name** and **content** are attributes of the **\<meta\>** tag.

- **author** is a meta attribute that provides the author of the page.

- **description** is a meta attribute that provides the description of the page.

- The **\<link\>** element has 3 attributes: **rel** (relation), **href** (HyperText Reference) and **type** (file type).

- **rel** is set to *stylesheet* for css files and *icon* for image files.

- **href** is the relative path of the file.

- **type** is set to i*mage/x-icon* for image files, *text/css* for css files and *text/js* for javascript files.

- Using the **\<style\>** element is referred to as **inline styling**. This is generally avoided and the styles for a page are linked in the **\<head\>** element using a **\<link\>** tag to a css file containing them.
